                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBCELLULAR LOCATION: Secreted; extracellular matrix. ALTERNATIVE PROPURTS: At least 2 isofoles; V0 (shown hore) and V1; are produced by alternative splicing.
TISSUE SPECIFICITY: Prechandrogenic condensation area of developing limb buds.
DEVELOPMENTAL STAGE: Disappears after the cartilage development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (By similarity)

-i- EUNCTION: CATALYZES THE CONVERSION OF 3%-PHOSPHARE TO A 2%,3%-
CYCLIC PHOSPHODIESTER AT THE END OF RNA. THE MECHANISM OF ACTION
OF THE ENZYME OCCURS IN 3 STEPS: (A) ADENYLATION OF THE ENZYME BY
ATP; (B) THE ENZYME ACTS ON RNA.N3%-P TO PRODUCE RNA-93%-PAS%-(C)
A NON CATALYTIC NUCLEOPHTIC ATTACK BY THE ADJACENT 2*HYLMOXYL ON
THE PHOSPHORUS IN THE DIESTEP LINKAGE TO PROCUCE THE CYCLIC END
PRODUCT THE BIOLOGICAL POLE OF THIS ENZYME IS ONKOMEN BUT IT IS
LIKELY TO FUNCTION IN SOME ASPECTS OF CELLULAR PNA PROCESSING (BY
SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   015746;

FEMS Microbiol. Lett. 141:183-188(1996).

-!- CATALYTIC ACTIVITY: Random hydrolysis of 1,4-beta-D-mannesidic linkages in mannans, galactomannans, glucomannans, and galactoglucomannans.

-!- SIMILARITY: THE 39 AA REPEATS ARE SIMILAR TO THOSE IN MANA, MANC AND XYNA, AND TO THOSE OF N. PATRICIARUM XYNA.

PROC. Natl. THE ABC EXCISION NUCLEASE IS A DNA REPAIR ENZYME THAT CATALYZES THE EXCISION REACTION OF UV-DAMAGED NUCLEOTIDE SEGMENTS PRODUCING OLIGOMERS HAVING THE MODIFIED BASE(S). ATTACHES TO THE UVRA-UVRB COMPLEX, DISPLACING UVRA, AND THE DAMAGED NA STRAND IS NICKED ON BOTH SIDES OF THE DAMAGED SITE (BY SIMILARITY).

PRODUCT: Consists of three subunits; uvra, uvrB and uvrc.

PROBLELLULAP LOCATION: Cytoplismic (By Similarity)

PROBLELLULAP LOCATION: Cytoplismic (By Similarity)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
